CS543 WEB SERVICES — ASSIGNMENT 3

Smart Contact Manager (SCM)

SOAP/WSDL Integration Service — Repository-Aligned Revision

Team ID	12
Team members	Aman Bali — 20251651015; Bhupesh Kumar — 20251651032
Existing service	SCM Integration Service · port 8086
Operation	VerifyPhoneNumber
Source	SERVICE_BASED/integration-service/.../SoapIntegrationService.java

This revised assignment replaces the earlier fictional QuickPing SMS partner with the SOAP contract already present in SCM. The WSDL is aligned to the `TelecomDirectoryService` definition in the uploaded repository. Request and response XML are illustrative contract examples, not evidence of a real external provider.

1. Service context

SCM exposes a dedicated Integration Service on port 8086. Its controller provides `GET /v1/soap/wsdl`, `GET /v1/soap/metadata`, `POST /v1/soap/execute`, `GET /v1/resilience/status`, and `POST /v1/resilience/state`. The WSDL operation is `VerifyPhoneNumber`, with SOAPAction `http://scm.enterprise.io/ws/telecom/VerifyPhoneNumber`.

2. WSDL contract

WSDL component	SCM-aligned value
Service	TelecomDirectoryService
Port type	TelecomDirectoryPortType
Operation	VerifyPhoneNumber
Request fields	phoneNumber, countryCode
Response fields	carrier, lineType, valid
SOAP endpoint	http://localhost:8086/v1/soap/mock-endpoint
Resilience	3-second timeout, bounded retry, circuit breaker (configured in the existing service)

3. HTTP/SOAP binding

```
GET http://localhost:8086/v1/soap/wsdl
POST http://localhost:8086/v1/soap/execute
Content-Type: application/json
SOAPAction: http://scm.enterprise.io/ws/telecom/VerifyPhoneNumber

The /soap/execute route accepts the SCM bridge JSON payload and
constructs/executes a SOAP request internally. The standalone XML
files in this package illustrate the SOAP message contract.
```

4. Fault handling

The current checked-in WSDL does not declare a named WSDL fault. The accompanying `soap-fault.xml` is an illustrative downstream SOAP Server fault (`UPSTREAM_UNAVAILABLE`, retryable=true), included to support the Assignment 4 comparison of SOAP fault detail with a stable REST problem response. Do not describe this example as a fault declared by the WSDL.

5. Corrections from the earlier draft

The earlier draft used a fictional QuickPing SMS Gateway and a made-up SendSms operation. That did not match the uploaded SCM repository. This revision uses the existing Telecom Directory SOAP/WSDL bridge and service port 8086, so Assignment 3 now aligns with SCM and the Assignment 4 notes.
